Test Design & Methodology

How Conversion Lift Works

Conversion Lift measures causal differences in conversion behavior

We create a **control group** out of the pool of users that would have seen your ad, but instead of showing your ad, **we show the next ad in the auction.**

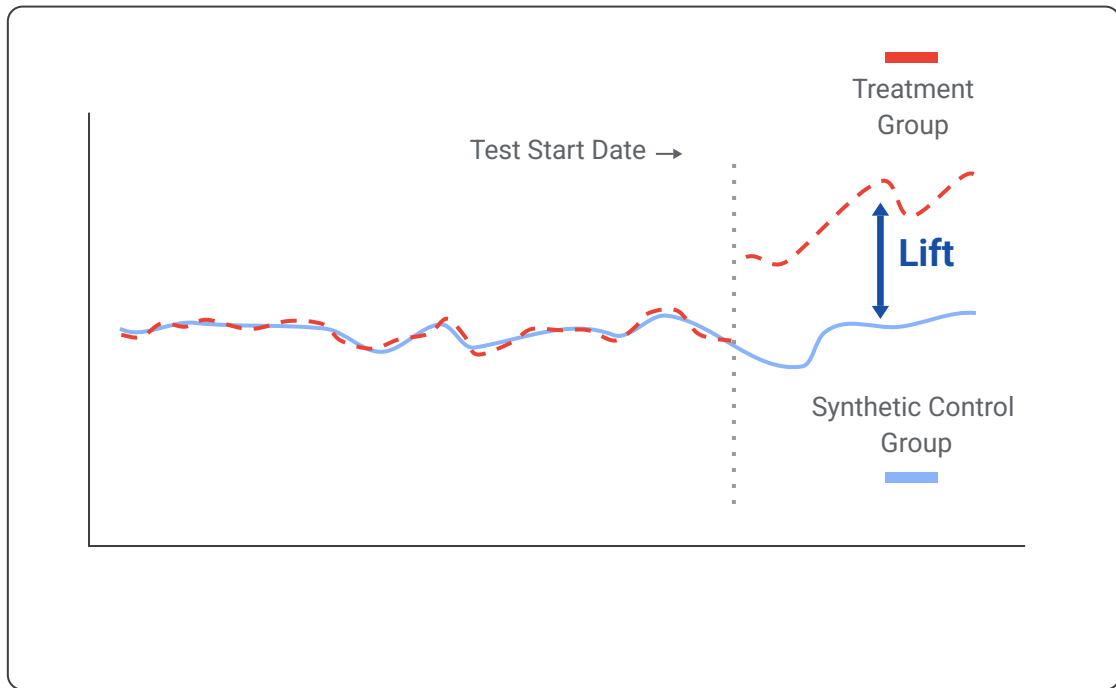

How Matched Markets w/ Time Based Regression Works

Time Based Regression measures causal differences in test market behavior vs a counterfactual

Once the test period starts, **conversion behavior between test and a synthetic control group is analyzed** to understand the impact ads on have on conversion volume to **assess the incremental impact of advertising**.

Test Design

Study Objective / Hypothesis

Campaigns in study with current creative / targeting will drive incremental conversions at an efficient iCPA

Design	Details
Test Campaigns	Campaigns: • dr_discovery_dg_video_consideration_mar26
Test Period	Flight Duration: Mar 19* to Apr 15 Study Period: Mar 22 to Apr 15 Cooldown Period: Apr 16 to Apr 19 * Flight began Mar 19 but did not start spending with an significance until March 22
Test Spend	\$499,638.19
Treatment and Control Groups	Treatment group: 41 DMAs Control group: 49 DMAs

Study Results

Unique Visitors

Executive Summary Study Period Only

Unique Visitors

+237.5k

Absolute Lift

Difference between treatment and control. Shows the number of incremental conversions caused by media.

237554 [233547, 241562]

66.2%

Relative Lift

Represents the lift % of conversions in the treatment group divided by conversions in the control group.

66.15% [60.15%, 72.87%]

\$2.03

iCPA

The incremental cost invested during the study divided by the absolute lift in conversions. The per unit cost to drive incremental lift.

\$2.03 [\$2.00, \$2.06]

39.8%

Incrementality Factor

Absolute lift / attributed conversions. % of attributed conv. that were actually **caused** by the marketing activity.

39.81% [38.85%, 40.76%]

Executive Summary Including Cooldown

Unique Visitors

+240k

Absolute Lift

Difference between treatment and control. Shows the number of incremental conversions caused by media.

239855 [235505, 244205]

54.7%

Relative Lift

Represents the lift % of conversions in the treatment group divided by conversions in the control group.

54.69% [49.87%, 60.19%]

\$2.01

iCPA

The incremental cost invested during the study divided by the absolute lift in conversions. The per unit cost to drive incremental lift.

\$2.01 [\$1.97, \$2.05]

35.4%

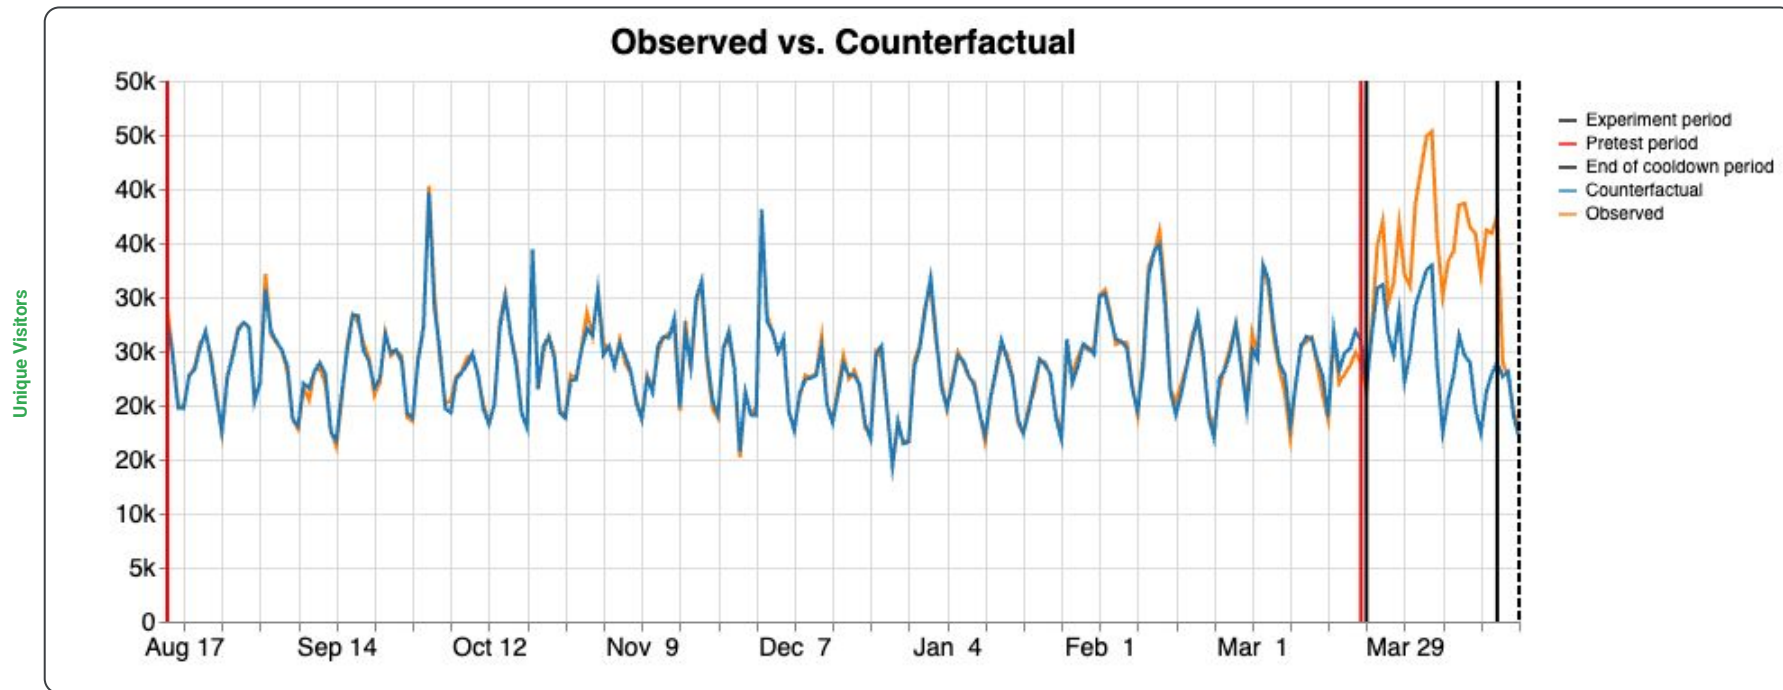

Incrementality Factor

Absolute lift / attributed conversions. % of attributed conv. that were actually **caused** by the marketing activity.

35.35% [34.50%, 36.23%]

Executive Summary Including Cooldown

CTA Taps*

+4,737

Absolute Lift

Difference between treatment and control. Shows the number of incremental conversions caused by media.

4737 [4016, 5457]

54.7%

Relative Lift

Represents the lift % of conversions in the treatment group divided by conversions in the control group.

5.48% [3.32%, 8.91%]

\$102

iCPA

The incremental cost invested during the study divided by the absolute lift in conversions. The per unit cost to drive incremental lift.

\$101.76 [\$88.33, \$120.02]

5.2%

Incrementality Factor

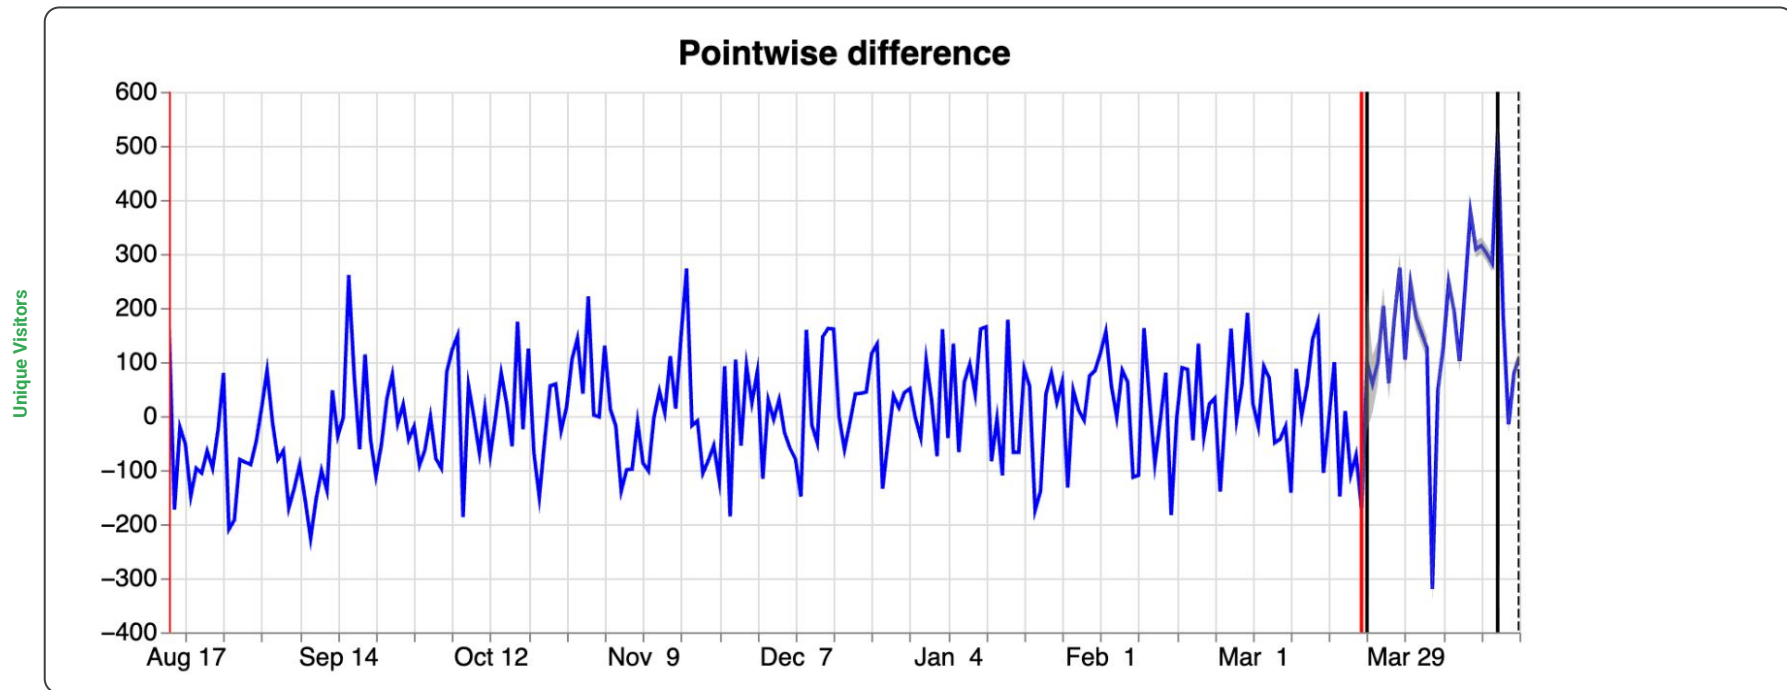

Absolute lift / attributed conversions. % of attributed conv. that were actually **caused** by the marketing activity.

5.20% [4.37%, 6.02%]

Note: This data is extremely noisy due to poor fit between treatment and control.

Pointwise Impact (Δ vs Counterfactual)

Conversion Category: Total CTA Taps
